A navigator on an airplane knows that the plane's velocity through the air is 250 km/h on a bearing of 237 degrees measured clockwise from north. By observing the motion of a plane's shadow across the ground, she finds to her surprise that the plane's ground speed is only 52 km/h and its direction is along a bearing of 15. She realizes that ground velocity is the vector sum of the plane's air ...
